

***Helicina* (*Helicina*) *microdina huberi* subsp. nov., a new  
land snail from northern Venezuela and Colombia**

A.S.H. BREURE

Department of Systematic Zoology and Evolutionary Biology of the University,  
c/o Rijksmuseum van Natuurlijke Historie, Leiden

During a recent collecting trip<sup>1</sup> two short visits were paid to the National Park "Henri Pittier" in the State of Aragua, Venezuela. A survey of the land snails found in this area is given by Breure (1976). The collection, kept in the Rijksmuseum van Natuurlijke Historie, Leiden (RMNH), contains the following new form.

***Helicina* (*Helicina*) *microdina huberi* subsp. nov.**

Description. — Shell imperforate, with slightly convex sides, rather solid. Colour brownish. Surface with rather coarse growth-striae and distinct spiral cords. Whorls nearly flat, the last whorl faintly keeled at the periphery; suture well impressed, slightly descending in front. Aperture oblique, ellipsoid-ovate. Peristome thickened, reflexed, with a dent-like tubercle on the basal margin.

Type locality. — Venezuela, Estado Aragua, Parque Nacional "Henri Pittier", 56.9 km NW. Maracay, on the road to Turiamo, selva veranera, 65 m a.s.l., A.S.H. Breure leg., 31-V-1975.

Type material. — Holotype RMNH 55119. Four paratypes RMNH

<sup>1</sup> This trip was made possible by a grant from the Foundation for the Advancement of Tropical Research (WOTRO), for which I am most grateful.
